New Hirox Equipment for the Lab

The new Hirox KH-7700 is not only more user friendly than our old equipment, but also provides more accurate measurement, analysis, and output capabilities. Enhanced 3-dimensional image synthesis and image comparison will improve our analysis capabilities. A new report generation feature will save a significant amount time and standardize our documentation. This compact system includes a digital camera, light source, LCD monitor, computer and software which are all integrated into one compact unit.

Hirox is a high-end quality lens and optical system manufacturer located in Tokyo, Japan. Hirox created the first digital microscope in 1986.
